Semantic memory is recall of general facts, while episodic memory is recall of personal facts. Forgetting

### Memory: Quick Review | SparkNotes

A neuropsychiatric test to measure the ability to remember heard words and the categories in which they belong. The subject listens to 16 items (four items in each of four categories) and then repeats as many of those items as he or she can recall. The subject is assessed on the number of terms retained and on the ability to recall that a particular item that he or she failed to recall may be from a particular category, e.g., a fruit or a color.

Short-term memory has a limited capacity of about seven plus or minus two pieces of information. Chunking allows people to combine many small pieces of information into fewer, bigger pieces of information. As long as people have fewer than about nine chunks of information, they will probably be able to hold that information in short-term memory.
